

# Bootstrap

Bootstrap

# Django Bootcamp

- Welcome to the Bootstrap Section!
- Bootstrap is a very common framework used for Front-End Development
- What is a Framework?

# Django Bootcamp

- Framework
  - Inversion of Control
  - Default Behavior
  - Extensibility
  - Non-modifiable Framework Code

# Django Bootcamp

- A large part of Bootstrap is not memorization but really understanding how to reference the documentation for your own use cases
- This section will focus on common uses of Bootstrap

# Bootstrap v3 versus v4

Bootstrap

# Django Bootcamp

- Bootstrap 4 is currently in development and will be released soon!
- It may be released by the time you view this, but if it hasn't yet, you can always use the alpha and beta versions right now!

# Django Bootcamp

- For our level of use of Bootstrap, the differences between v3 and v4 won't really be apparent to us
- v4 is a major rewrite from v3, but we won't dive deep enough to notice many of these differences

# Django Bootcamp

- Some differences:
  - Panels are being replaced by cards
  - Larger default font sizes
  - New grid tier (XL)
  - Use of flexbox
  - Moved from Less to Sass

# Django Bootcamp

- The most important thing to get out of this section is the ability to reference the Bootstrap documentation
- Now let's explore the documentation and some examples of what bootstrap looks like!

# Bootstrap - Part 1

## Buttons

Bootstrap

# Django Bootcamp

- A key feature of Bootstrap are its default classes
- You can call these classes to quickly and easily build good looking features for your web application!

# Django Bootcamp

- We'll go over button classes as well as container and Jumbotron classes.
- First we will start off by showing how to connect an HTML file to Bootstrap!
- Let's get started!

# Bootstrap - Part 2

## Forms

Bootstrap

# Django Bootcamp

- A quick note before we begin to discuss Forms with Bootstrap.
- Many students get intimidated by Bootstrap, thinking they need to memorize all the classes we cover in this section.

# Django Bootcamp

- That is certainly not the case!
- Think of this section more as a guide to the documentation and what is possible with Bootstrap, not as an overview of things you need to memorize!

# Django Bootcamp

- Even people who work with Bootstrap often will reference the documentation a lot.
- We want to master the skill of gathering and applying information, not memorizing information!

# Django Bootcamp

- Bootstrap comes with many default classes for forms.
- Let's explore the various form components we can use with Bootstrap!
- We will be referencing the course notes quite a bit!

# Bootstrap - Part 3

## Navbars

Bootstrap

# Django Bootcamp

- Navbars are navigational bars that you will often see on the top of a website
- In this section we will show how to manually create the basics of a NavBar
- Later on we will just copy and paste from the course notes!

# Django Bootcamp

- We will also see how to connect an HTML page to Javascript and jQuery
- We haven't really discussed those two technologies yet, but we will need them for some functionality of the NavBar!
- Let's get started!

# Bootstrap - Part 4

## Grids

Bootstrap

# Django Bootcamp

- The grid system for Bootstrap is one of its most fundamental features
- So far we've mostly seen convenient tools that Bootstrap provides through classes.
- The grid system goes much further than that!

# Django Bootcamp

- The grid system provides the core mechanism by which using Bootstrap allows websites to look good across multiple devices of multiple screen sizes
- Let's get started!

# Django Bootcamp

- What happens on different screen sizes?

# Django Bootcamp

- We split the entire screen into 12 available columns.

# Django Bootcamp

- We can use any combination of numbers that will eventually add up to 12 columns

# Django Bootcamp

- The grid system call will make use of the `class="row"`

# Django Bootcamp

- Inside of a row class, we then have the following format:
  - col-ScreenSize-NumberOfColumns

# Django Bootcamp

- Inside of a row class, we then have the following format:
  - col-md-6

# Django Bootcamp

- So we can define how the columns should be shown when the screen gets resized.
- Let's get started with some examples!

# Bootstrap Project

# Django Bootcamp

- For this project you will be recreating a landing page and a Sign-In page that take advantage of Bootstrap's features.
- Open the `Bootstrap_Project_Main.html` file to see the full instructions.

# Django Bootcamp

- Remember that you can either tackle this project on your own first, or just follow along with Solutions Lecture, whichever you prefer!
- Let's take a quick look at the project!

# **Bootstrap Project Solutions**

# Capstone Project One Solutions - Continued

# Django Bootcamp

- We've learned a lot about HTML and CSS, two major components of any website.
- Before we move on to Bootstrap, let's take a moment to practice everything we've learned so far with a Capstone Project!

# Django Bootcamp

- You will be creating a mock landing page for a start-up.
- The landing page will have a form and lead to a Thank You page.
- This capstone project is optional and there are three ways you can approach it!

# Django Bootcamp

- If you feel very confident in HTML and CSS feel free to just skip this project
- You can just follow along with the solution videos.
- Try to recreate the landing page before watching the walkthrough videos.

# Django Bootcamp

- Let's take a look at the Landing Page, see the requirements, and then you can get started!

# Command Line Crash Course

# Django Bootcamp

- Being able to navigate your computer through the command line is a vital skill for any web developer!
- Some commands are slightly different depending on if you use Windows or MacOS/Linux

# Django Bootcamp

- In this lecture we will briefly go over a few important commands you should know and point out OS differences
- You can always use the downloaded notes for reference!
